

HYDRAULIC TABLE

A lift table is a work platform that allows handlers to raise or lower any type of heavy load. This elevator is a safety device for transporting materials, and it constitutes an alternative to a conventional lift.

A hydraulic lift table is also an elevator capable of adjusting to tight spaces as well as moderate travel speeds. The peculiarity of a hydraulic lift table is that it generally has a manual control as well as a hydraulic jack and a scissor system. Like a lever system, these make it possible to amplify movements and therefore lift heavier loads, which greatly helps the handler without them getting too tired.
